`GetChildContentAsync()`. You must call `async` methods only from other `async` methods; otherwise, you can get problems such as thread starvation. For more details, see Microsoft's "ASP.NET Core Best Practices" at http://mng.bz/KM7X.

The Tag Helpers in this section represent a small sample of possible avenues you could explore, but they cover the two broad categories: Tag Helpers for rendering new content and Tag Helpers for controlling the rendering of other elements.

TIP For further details and examples, see Microsoft's "Author Tag Helpers in ASP.NET Core" documentation at http://mng.bz/Idb0.

Tag Helpers can be useful for providing small pieces of isolated, reusable functionality like this, but they're not designed to provide larger, application-specific sections of an app or to make calls to business-logic services. Instead, you should use view components, as you'll see in the next section.

32.2 View components: Adding logic to partial views

In this section you'll learn about *view components*, which operate independently of the main Razor Page and can be used to encapsulate complex business logic. You can use view components to keep your main Razor Page focused on a single task—rendering the main content—instead of also being responsible for other sections of the page.

If you think about a typical website, you'll notice that it may have multiple independent dynamic sections in addition to the main content. Consider Stack Overflow, shown in figure 32.3. As well as the main body of the page,
