- You can use layouts in your view components' views to extract rendering logic common to a specific view component. This layout may contain `@sections`, as you saw in chapter 7, but these sections are independent of the main Razor view's layout.
- View components are isolated from the Razor Page they're rendered in, so you can't, for example, define a `@section` in a Razor Page layout and then add that content from a view component; the contexts are completely separate.
- When using the `<vc:my-recipes>` Tag Helper syntax to invoke your view component, you must import it as a custom Tag Helper, as you saw in section 32.1.
- Instead of using the Tag Helper syntax, you may invoke the view component from a view directly by using `IViewComponentHelper Component`, though I don't recommend using this syntax, as in this example:

```
@await Component.InvokeAsync("MyRecipes", new { numberOfRecipes = 3 })
```

We've covered Tag Helpers and view components, which are both features of the Razor engine in ASP.NET Core. In the next section you'll learn about a different but related topic: how to create a custom `DataAnnotations` attribute. If you've used older versions of ASP.NET, this will be familiar, but ASP.NET Core has a couple of tricks up its sleeve to help you out.

32.3 Building a custom validation attribute
