```
    [Required]                                  ❶
    [Range(1, 1000)]                            ❸
    public decimal Quantity { get; set; }
}
```

❶ All the properties are required.

❷ The strings must be exactly three characters.

❸ The quantity can be between 1 and 1000.

There's some basic validation on this model, but during testing you identify a problem: users can enter any three-letter string for the `CurrencyFrom` and `CurrencyTo` properties. Users should be able to choose only a valid currency code, like `"USD"` or `"GBP"`, but someone attacking your application could easily send `"XXX"` or `"£$%"`.

Assuming that you support a limited set of currencies—say, GBP, USD, EUR, and CAD—you could handle the validation in a few ways. One way would be to validate the `CurrencyFrom` and `CurrencyTo` values within the Razor Page handler method, after model binding and attribute validation has already occurred.

Another way would be to use a `[RegularExpresssion]` attribute to look for the allowed strings. The approach I'm going to take here is to create a custom `ValidationAttribute`. The goal is to have a custom validation attribute you can apply to the `CurrencyFrom` and `CurrencyTo` attributes, to restrict the range of valid values. This will look something like the following example.

Listing 32.7 Applying custom validation attributes to the binding model

```
public class CurrencyConverterModel
{
    [Required]
    [StringLength(3, MinimumLength = 3)]
```
