- If you need to create a custom validation rule, you can use the `Must()` method to specify a predicate. If you wish to reuse the validation rule across multiple models, encapsulate the rule as an extension method to reduce duplication.
- To add FluentValidation to your application, install the FluentValidation .AspNetCore NuGet package, call `AddFluentValidationAutoValidation()` in Program.cs, and register your validators with the DI container. This will add FluentValidation validations in addition to the built-in `DataAnnotations` system.
- To remove the `DataAnnotations` validation system and use FluentValidation only, set the `DisableDataAnnotationsValidation` option to `true` in your call to `AddFluentValidationAutoValidation()`. Favor this approach where possible to avoid running validation methods from two different systems.
- You can allow FluentValidation to automatically discover and register all the validators in your application by calling `AddValidatorsFromAssemblyContaining<T>()`, where `T` is a type in the assembly to scan. This means you don’t have to register each validator in your application with the DI container individually.
