9.5 Resolving scoped services outside a request

10 Configuring an ASP.NET Core application

10.1 Introducing the ASP.NET Core configuration model

10.2 Building a configuration object for your app

Adding a configuration provider in Program.cs

Using multiple providers to override configuration values

Storing configuration secrets safely

Reloading configuration values when they change

10.3 Using strongly typed settings with the options pattern

Introducing the IOptions interface

Reloading strongly typed options with IOptionsSnapshot

Designing your options classes for automatic binding

Binding strongly typed settings without the IOptions interface

10.4 Configuring an application for multiple environments

Identifying the hosting environment

Loading environment-specific configuration files

Setting the hosting environment

11 Documenting APIs with OpenAPI

11.1 Adding an OpenAPI description to your app

11.2 Testing your APIs with Swagger UI

11.3 Adding metadata to your minimal APIs

11.4 Generating strongly typed clients with NSwag

Generating a client using Visual Studio

Generating a client using the .NET Global tool

Using a generated client to call your API

Customizing the generated code

Refreshing the OpenAPI description

11.5 Adding descriptions and summaries to your endpoints

Using fluent methods to add descriptions

Using attributes to add metadata
