1. Add the Microsoft.Extensions.Hosting.WindowsServices NuGet package to your application using Visual Studio by running `dotnet add package Microsoft.Extensions.Hosting.WindowsServices` in the project folder, or by adding a `<PackageReference>` to your .csproj file:

```
<PackageReference Include="Microsoft.Extensions.Hosting.WindowsServices"
➥ Version="7.0.0" />
```

2. Add a call to `UseWindowsService()` on your `IHostBuilder`, as shown in listing 34.9.

3. Publish your application, as described in chapter 27. From the command line you could run `dotnet publish -c Release` from the project folder.

4. Open a command prompt as Administrator and install the application using the Windows `sc` utility. You need to provide the path to your published project's .exe file and a name to use for the service, such as `My Test Service`:

```
sc create "My Test Service" BinPath="C:\path\to\MyService.exe"
```

5. You can manage the service from the Services control panel in Windows, as shown in figure 34.3. Alternatively, to start the service from the command line run `sc start "My Test Service"`, or to delete the service run `sc delete "My Test Service"`.

After you complete the preceding steps, your worker service will be running as a Windows Service.
