- To run a worker service or ASP.NET Core app as a Windows Service, add the Microsoft.Extensions.Hosting.WindowsServices NuGet package, and call `UseWindowsService()` on `IHostBuilder`. You can install and manage your app with the Windows `sc` utility.
- To install a Linux systemd daemon, add the Microsoft.Extensions.Hosting.Systemd NuGet package and call `AddSystemd()` on `IHostBuilder`. Both the Systemd and Windows Service integration packages do nothing when running the application as a console app, which is great for testing your app. You can even add both packages so that your app can run as a service in both Windows and Linux.
- Quartz.NET runs jobs based on triggers using advanced schedules. It builds on the `IHostedService` implementation to add extra features and scalability. You can install Quartz by adding the Quartz.AspNetCore NuGet package and calling `AddQuartz()` and `AddQuartzHostedService()` in `ConfigureServices()`.
- You can create a Quartz.NET job by implementing the `IJob` interface. This requires implementing a single method, `Execute`. You can enable DI for the job by calling `UseMicrosoftDependencyInjectionJobFactory` in `AddQuartz()`. This allows you to directly inject scoped (or transient) services into your job without having to create your own scopes.
