hosting model 684 – 692
choosing deployment method 690 – 692
running vs. publishing 686 – 690
inner workings of 4 – 8
HTTP web requests 5 – 7
processing requests 7 – 8
logging abstractions 658 – 659
middleware pipeline 772 – 788
motivations for creating 15 – 17
ovewview of 1 – 2
paradigms of 18 – 21
reasons to choose 3 – 4
routing in 340 – 342
testing in 873 – 875
types of applications you can build with 2 – 3
web frameworks 13 – 14
when to use 21 – 29
.NET Framework developers creating new application 23 – 27
converting existing ASP.NET applications to ASP.NET Core 27 – 29
developers who are new to .NET development 22 – 23
ASP.NET Core apps
authentication for 624 – 631
centralizing authentication in identity providers 626 – 629
extending authentication to multiple apps 624 – 626
OIDC and OAuth 2.0 629 – 631
building with generic host and Startup class 753 – 770
complexity of generic host 764 – 767
creating custom IHostBuilder 761 – 764
minimal hosting vs. generic host 767 – 768
Program class 755 – 757
separating concerns between two files 754
Startup class 757 – 761
installing Quartz.NET 862 – 864
rejecting HTTP requests in 722 – 723
signing in to 562 – 564
testing 887 – 911
ASP.NET Core Identity
adding custom data to users 586 – 588
adding to existing projects 578 – 583
configuring services 579 – 580
updating EF Core data model to support Identity 581
updating Razor views to link to Identity UI 582 – 583
creating projects 568 – 578
data model 573 – 576
exploring templates in Solution Explorer 570 – 572
from templates 569 – 570
interacting with Identity 576 – 578
customizing pages in default UI 583 – 586
overview of 566 – 568
ASP.NET Core web applications 30 – 54, 215 – 247
