```
app.UseDeveloperExceptionPage();
```

NOTE As shown previously, `WebApplication` automatically adds this middleware to your middleware pipeline when you're running in the `Development` environment, so you don't need to add it explicitly. You'll learn more about environments in chapter 10.

When an exception is thrown and propagates up the pipeline to this middleware, it's captured. Then the middleware generates a friendly HTML page, which it returns with a 500 status code, as shown in figure 4.15. This page contains a variety of details about the request and the exception, including the exception stack trace; the source code at the line the exception occurred; and details on the request, such as any cookies or headers that were sent.
