
Request
Response
Static-file middleware
Routing middleware
CORS middleware
Authentication middleware
Authorization middleware
Endpoint middleware
Routing table
/product/{id}
Endpoint: ProductPageModel Values: Id=1
/
Endpoint: () => "Hello world!"
() => "Hello world!" endpoint
Middleware placed before the routing middleware cannot tell which endpoint will be executed.
The routing middleware selects an endpoint based on the request URL and application's route templates.
The CorsMiddleware is placed after the routing middleware so it can determine which endpoint was selected and access metadata about the endpoint.
Middleware placed before the AuthenticationMiddleware will not see the request as authenticated. Middleware placed afterward can access the ClaimsPrincipal.
The AuthorizationMiddleware must be placed after Authentication so the user is known. It must be placed before the endpoint middleware.
The endpoint middleware executes the selected endpoint and returns the response.
