Having these details available when an error occurs is invaluable for debugging a problem, but they also represent a security risk if used incorrectly. You should never return more details about your application to users than absolutely necessary, so you should use `DeveloperExceptionPage` only when developing your application. The clue is in the name!

WARNING Never use the developer exception page when running in production. Doing so is a security risk, as it could publicly reveal details about your application's code, making you an easy target for attackers. `WebApplication` uses the correct behavior by default and adds the middleware only when running in development.

If the developer exception page isn't appropriate for production use, what should you use instead? Luckily, you can use another type of general-purpose error-handling middleware in production: `ExceptionHandlerMiddleware`.

4.3.2 Handling exceptions in production: ExceptionHandlerMiddleware

The developer exception page is handy when you're developing your applications, but you shouldn't use it in production, as it can leak information about your app to potential attackers. You still want to catch errors, though; otherwise, users will see unfriendly error pages or blank pages, depending on the browser they're using.

You can solve this problem by using `ExceptionHandlerMiddleware`. If an error occurs in your application, the user will see a custom error response that's consistent with
