displayed to the user. In the example in listing 4.5, you used an error handling path of `"/error"`:

```
app.UseExceptionHandler("/error");
```

`ExceptionHandlerMiddleware` invokes this path after it captures an exception to generate the final response. The ability to generate a response dynamically is a key feature of `ExceptionHandlerMiddleware`; it allows you to reexecute a middleware pipeline to generate the response sent to the user.

Figure 4.18 shows what happens when `ExceptionHandlerMiddleware` handles an exception. It shows the flow of events when the minimal API endpoint for the `"/"` path generates an exception. The final response returns an error status code but also provides an error string, using the `"/error"` endpoint.
