The cross-platform, lightweight design of ASP.NET Core means that it lends itself well to acting as a backend for your SPA framework of choice. Given the focus of this book and the broad scope of SPAs in general, I won't be looking at Angular, React, or other SPAs here. Instead, I suggest checking out the resources appropriate to your chosen SPA. Books are available from Manning for all the common client-side JavaScript frameworks, as well as Blazor:

- *React in Action*, by Mark Tielens Thomas (Manning, 2018)
- *Angular in Action*, by Jeremy Wilken (Manning, 2018)
- *Vue.js in Action*, by Erik Hanchett with Benjamin Listwon (Manning, 2018)
- *Blazor in Action*, by Chris Sainty (Manning, 2022)

After you've established that you need an HTTP API for your application, creating one is easy, as it's the default application type in ASP.NET Core! In the next section we look at various ways you can create minimal API endpoints and ways to handle multiple HTTP verbs.

5.2 Defining minimal API endpoints

Chapters 3 and 4 gave you an introduction to basic minimal API endpoints. In this section, we'll build on those basic apps to show how you can handle multiple HTTP verbs and explore various ways to write your endpoint handlers.

5.2.1 Extracting values from the URL with routing

You've seen several minimal API applications in this book, but so far, all the examples have used fixed paths to define the APIs, as in this example:

```
app.MapGet("/", () => "Hello World!");
app.MapGet("/person", () => new Person("Andrew", "Lock");
```
