You should use `GET` only to *get* data from the server, however. You should never use it to *send* data or to *change* data on the server. Instead, you should use an HTTP verb such as `POST` or `DELETE`. You generally can't use these verbs by navigating web pages in the browser, but they're easy to send from a client-side SPA or mobile app.

TIP If you're new to web programming or are looking for a refresher, Mozilla Developer Network (MDN), maker of the Firefox web browser, has a good introduction to HTTP at http://mng.bz/KeMK.

In theory, each of the HTTP verbs has a well-defined purpose, but in practice, you may see apps that only ever use `POST` and `GET`. This is often fine for server-rendered applications like Razor Pages, as it's typically simpler, but if you're creating an API, I recommend that you use the HTTP verbs with the appropriate semantics wherever possible.

You can define endpoints for other verbs with minimal APIs by using the appropriate `Map*` functions. To map a `POST` endpoint, for example, you'd use `MapPost()`. Table 5.1 shows the minimal API `Map*` methods available, the corresponding HTTP verbs, and the typical semantic expectations of each verb on the types of operations that the API performs.

Table 5.1 The minimal API map endpoints and the corresponding HTML verbs
