The handlers for the `POST` and `PUT` endpoints in listing 5.2 accept both an `id` parameter and a `Fruit` parameter, showing another important feature of minimal APIs. *Complex types*—that is, types that can't be extracted from the URL by means of route parameters—are created by deserializing the JSON body of a request.

NOTE By contrast with APIs built using ASP.NET and ASP.NET Core web API controllers (which we cover in chapter 20), minimal APIs can bind only to JSON bodies and always use the System.Text.Json library for JSON deserialization.

Figure 5.3 shows an example of a `POST` request sent with Postman. Postman sends the request body as JSON, which the minimal API automatically deserializes into a `Fruit` instance before calling the endpoint handler. You can bind only a single object in your endpoint handler to the request body in this way. I cover model binding in detail in chapter 7.
