handle some of these scenarios by returning status codes.

5.3 Generating responses with IResult

You've seen the basics of minimal APIs, but so far, we've looked only at the happy path, where you can handle the request successfully and return a response. In this section we look at how to handle bad requests and other errors by returning different status codes from your API.

The API in listing 5.2 works well as long as you perform only operations that are valid for the current state of the application. If you send a `GET` request to `/fruit`, for example, you'll always get a `200` success response, but if you send a `GET` request to `/fruit/f1` *before* you create a `Fruit` with the `id` `f1`, you'll get an exception and a `500 Internal Server Error` response, as shown in figure 5.4.
