```
app.MapGet("/fruit/{id}", (string id) =>
    _fruit.TryGetValue(id, out var fruit)
        ? TypedResults.Ok(fruit)
        : Results.Problem(statusCode: 404));                          ❶

app.MapPost("/fruit/{id}", (string id, Fruit fruit) =>
    _fruit.TryAdd(id, fruit)
        ? TypedResults.Created($"/fruit/{id}", fruit)
        : Results.ValidationProblem(new Dictionary<string, string[]>  ❷
          {                                                           ❷
              {"id", new[] {"A fruit with this id already exists"}}   ❷
          }));                                                        ❷
```

❶ Returns a Problem Details object with a 404 status code

❷ Returns a Problem Details object with a 400 status code and includes the validation errors

The `ProblemHttpResult` returned by these methods takes care of including the correct title and description based on the status code, and generates the appropriate JSON, as shown in figure 5.5. You can override the default title and description by passing additional arguments to the `Problem()` and `ValidationProblem()` methods.
