5.3.3 Converting all your responses to Problem Details

In section 5.3.2 you saw how to use the `Results.Problem()` and `Results.ValidationProblem()` methods in your minimal API endpoints to return Problem Details JSON. The only catch is that your minimal API endpoints aren't the *only* thing that could generate errors. In this section you'll learn how to make sure that all your errors return Problem Details JSON, keeping the error responses consistent across your application.

A minimal API application could generate an error response in several ways:

- Returning an error status code from an endpoint handler
- Throwing an exception in an endpoint handler, which is caught by the `ExceptionHandlerMiddleware` or the `DeveloperExceptionPageMiddleware` and converted to an error response
- The middleware pipeline returning a `404` response because a request isn't handled by an endpoint
- A middleware component in the pipeline throwing an exception
- A middleware component returning an error response because a request requires authentication, and no credentials were provided

There are essentially two classes of errors, which are handled differently: exceptions and error status code responses. To create a consistent API for consumers, we need to make sure that both error types return Problem Details JSON in the response.
