Converting exceptions to Problem Details

In chapter 4 you learned how to handle exceptions with the `ExceptionHandlerMiddleware`. You saw that the middleware catches any exceptions from later middleware and generates an error response by executing an error-handling path. You could add the middleware to your pipeline with an error-handling path of `"/error"`:

```
app.UseExceptionHandler("/error");
```

`ExceptionHandlerMiddleware` invokes this path after it captures an exception to generate the final response. The trouble with this approach for minimal APIs is that you need a dedicated error endpoint, the sole purpose of which is to generate a Problem Details response.

Luckily, in .NET 7, you can configure the `ExceptionHandlerMiddleware` (and `DeveloperExceptionPageMiddleware`) to convert an exception to a Problem Details response automatically. In .NET 7, you can add the new `IProblemDetailsService` to your app by calling `AddProblemDetails()` on `WebApplicationBuilder.Services`. When the `ExceptionHandlerMiddleware` is configured *without* an error-handling path, it automatically uses the `IProblemDetailsService` to generate the response, as shown in figure 5.6.

WARNING Calling `AddProblemDetails()` registers the `IProblemDetailsService` service in the dependency injection container so that other services and middleware can use it. If you configure `ExceptionHandlerMiddleware` without an error-handling path
