- You've registered an `IProblemDetailsService` with the app (by calling `AddProblemDetails()` in Program.cs).
- The request indicates that it doesn't support HTML. If the client supports HTML, middleware uses the HTML developer exception page from chapter 4 instead.

The `ExceptionHandlerMiddleware` and `DeveloperExceptionPageMiddleware` take care of converting all your exceptions to Problem Details responses, but you still need to think about nonexception errors, such as the automatic `404` response generated when a request doesn't match any endpoints.

Converting error status codes to Problem Details

Returning error status codes is the common way to communicate errors to a client with minimal APIs. To ensure a consistent API for consumers, you should return a Problem Details response whenever you return an error. Unfortunately, as already mentioned, you don't control all the places where an error code may be created. The middleware pipeline automatically returns a `404` response when an unmatched request reaches the end of the pipeline, for example.

Instead of generating a Problem Details response in your endpoint handlers, you can add middleware to convert responses to Problem Details automatically by using the `StatusCodePagesMiddleware`, as shown in figure 5.7. Any response that reaches the middleware with an error status code and doesn't already have a body has a Problem Details body added by the middleware. The middleware converts all error responses
