Figure 5.7 The `StatusCodePagesMiddleware` intercepts responses with an error status code that have no response body and adds a Problem Details response body.

NOTE You can also use the `StatusCodePagesMiddleware` to reexecute the middleware pipeline with an error handling path, as you can with the `ExceptionHandlerMiddleware` (chapter 4). This technique is most useful for Razor Pages applications when you want to have a different error page for specific status codes, as you'll see in chapter 15.

Add the `StatusCodePagesMiddleware` to your app by using the `UseStatusCodePages()` extension method, as shown in the following listing. Ensure that you also add the `IProblemDetailsService` to your app by using `AddProblemDetails()`.

Listing 5.7 Using `StatusCodePagesMiddleware` to return Problem Details

```
WebApplicationBuilder builder = WebApplication.CreateBuilder(args);
builder.Services.AddProblemDetails();          ❶

WebApplication app = builder.Build();

if (!app.Environment.IsDevelopment())
{
    app.UseExceptionHandler();
}

app.UseStatusCodePages();                      ❷

app.MapGet("/", () => Results.NotFound());     ❸

app.Run();
```

❶ Adds the IProblemDetailsService implementation

❷ Adds the StatusCodePagesMiddleware
