❸ The StatusCodePagesMiddleware automatically adds a Problem Details body to the 404 response.

The `StatusCodePagesMiddleware`, coupled with exception-handling middleware, ensures that your API returns a Problem Details response for all error responses.

TIP You can also customize how the Problem Details response is generated by passing parameters to the `AddProblemDetails()` method or by implementing your own `IProblemDetailsService`.

So far in section 5.3, I've described returning objects as JSON, returning a `string` as text, and returning custom status codes and Problem Details by using `Results`. Sometimes, however, you need to return something bigger, such as a file or a binary. Luckily, you can use the convenient `Results` class for that task too.

5.3.4 Returning other data types

The methods on `Results` and `TypedResults` are convenient ways of returning common responses, so it's only natural that they include helpers for other common scenarios, such as returning a file or binary data:

- `Results.File()`—Pass in the path of the file to return, and ASP.NET Core takes care of streaming it to the client.
- `Results.Byte()`—For returning binary data, you can pass this method a `byte[]` to return.
- `Results.Stream()`—You can send data to the client asynchronously by using a `Stream`.
