to have some common code that doesn't fit into the specific pigeonholes of validation or authorization.

Luckily, ASP.NET Core includes a feature in minimal APIs for running these tangential concerns: endpoint filters. You can specify a filter for an endpoint by calling `AddEndpointFilter()` on the result of a call to `MapGet` (or similar) and passing in a function to execute. You can even add multiple calls to `AddEndpointFilter()`, which builds up an *endpoint filter pipeline*, analogous to the middleware pipeline. Figure 5.8 shows that the pipeline is functionally identical to the middleware pipeline in figure 4.3.

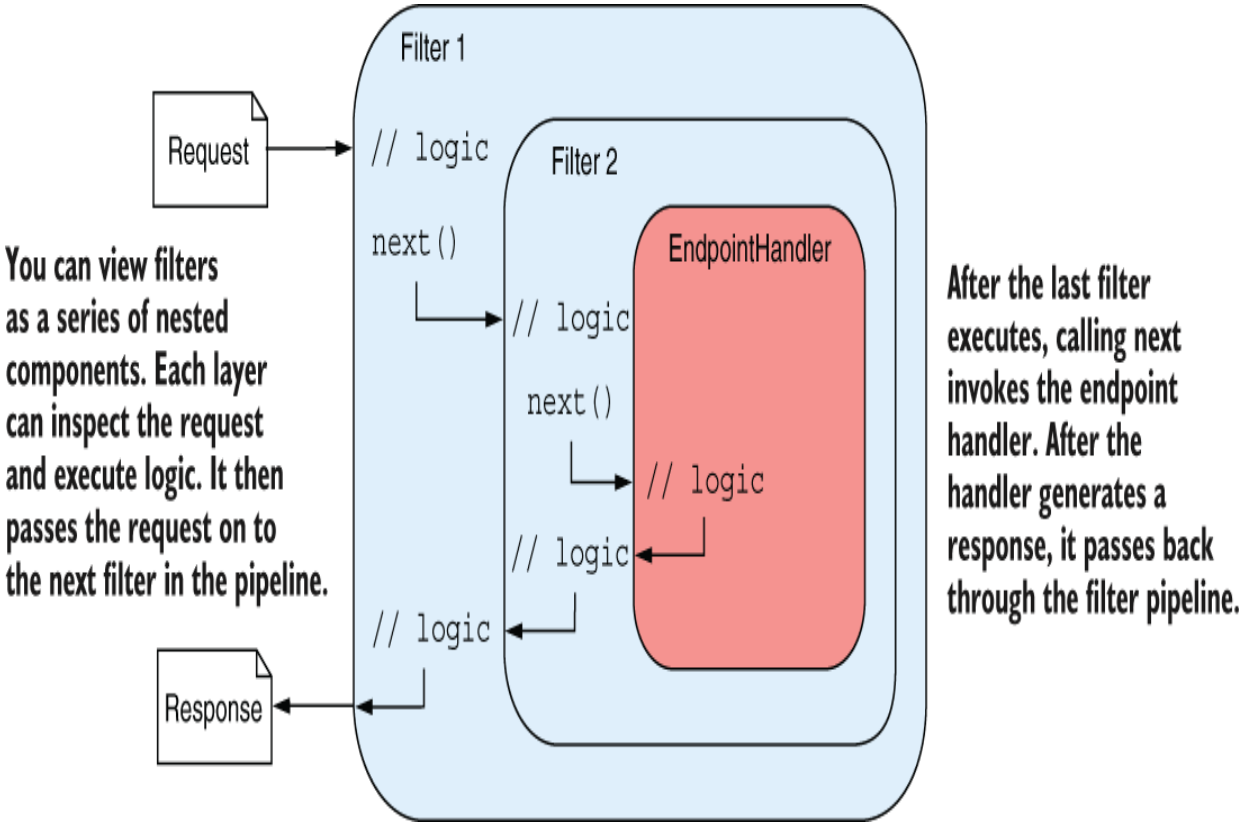

Figure 5.8 The endpoint filter pipeline. Filters execute code and then call `next(context)` to invoke the next filter in the pipeline. If there are
