Preparing your app for deployment to Linux

27.4 Configuring the URLs for your application

28 Adding HTTPS to an application

28.1 Why do I need HTTPS?

28.2 Using the ASP.NET Core HTTPS development certificates

28.3 Configuring Kestrel with a production HTTPS certificate

28.4 Enforcing HTTPS for your whole app

Enforcing HTTPS with HTTP Strict Transport Security headers

Redirecting from HTTP to HTTPS with HTTPS redirection middleware

Rejecting HTTP requests in API applications

29 Improving your application's security

29.1 Defending against cross-site scripting (XSS) attacks

29.2 Protecting from cross-site request forgery (CSRF) attacks

29.3 Calling your web APIs from other domains using CORS

Understanding CORS and how it works

Adding a global CORS policy to your whole app

Adding CORS to specific endpoints with EnableCors metadata

Configuring CORS policies

29.4 Exploring other attack vectors

Detecting and avoiding open redirect attacks

Avoiding SQL injection attacks with EF Core and parameterization

Preventing insecure direct object references

Protecting your users' passwords and data

Part 5 Going further with ASP.NET Core

30 Building ASP.NET Core apps with the generic host and Startup

30.1 Separating concerns between two files

30.2 The Program class: Building a Web Host

30.3 The Startup class: Configuring your application
