

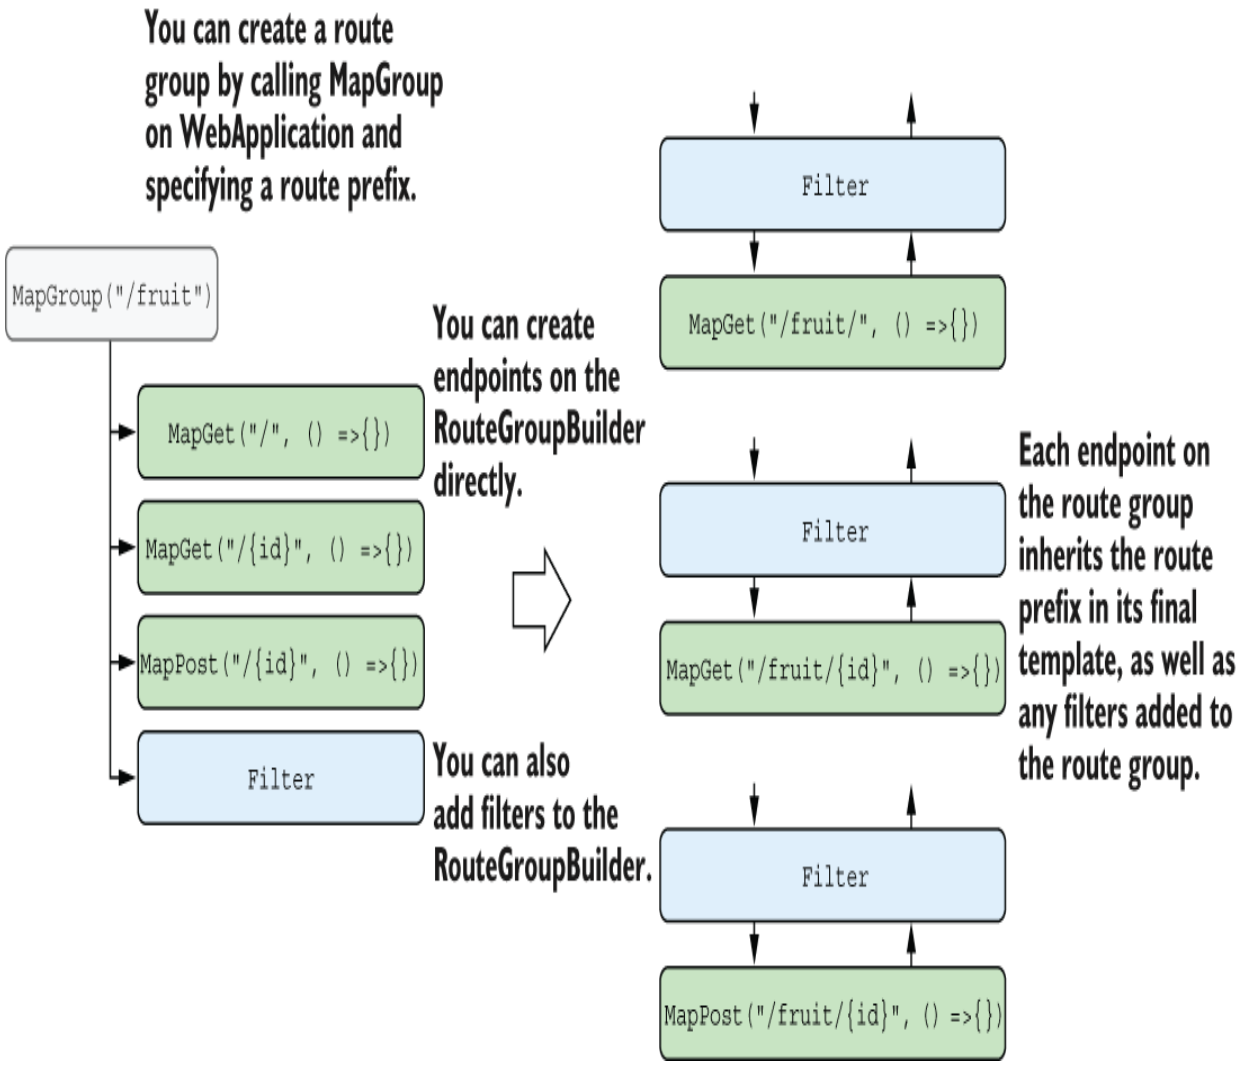

Figure 5.11 Using route groups to simplify the definition of endpoints. You can create a route group by calling `MapGroup()` and providing a prefix. Any endpoints created on the route group inherit the route template prefix, as well as any filters added to the group.

You can even create nested groups by calling `MapGroup()` on a group. The prefixes are applied to your endpoints in order, so the first `MapGroup()` call defines the prefix used at the start of the route. `app.MapGroup("/fruit").MapGroup("/citrus")`, for example, would have the prefix `"/fruit/citrus"`.
