```
    return Results.NoContent();
});

fruitApiWithValidation.MapDelete("/fruit/{id}", (string id) =>       ❺
{
    _fruit.TryRemove(id, out _);
    return Results.NoContent();
});

app.Run();
```

❶ Creates a route group by calling MapGroup and providing a prefix

❷ Endpoints defined on the route group will have the group prefix prepended to the route.

❸ You can create nested route groups with multiple prefixes.

❹ You can add filters to the route group . . .

❺ . . . and the filter will be applied to all the endpoints defined on the route group.

In .NET 6, minimal APIs were a bit too verbose to be generally recommended, but with the addition of route groups and filters, minimal APIs have come into their own. In chapter 6 you'll learn more about routing and route template syntax, as well as how to generate links to other endpoints.

Summary

- HTTP verbs define the semantic expectation for a request. `GET` is used to fetch data, `POST` creates a resource, `PUT` creates or replaces a resource, and `DELETE` removes a resource. Following these conventions will make your API easier to consume.
