- Add a filter to an endpoint by calling `AddEndpointFilter()` and providing the lambda function to run (or use a static/instance method). You can also implement `IEndpointFilter` and call `AddEndpointFilter<T>()`, where `T` is the name of your implementing class.
- You can generalize your filter functions by creating a factory, using the overload of `AddEndpointFilter()` that takes an `EndpointFilterFactoryContext.` You can use this approach to support endpoint handlers with various method signatures.
- You can reduce duplication in your endpoint routes and filter configuration by using route groups. Call `MapGroup()` on `WebApplication`, and provide a prefix. All endpoints created on the returned `RouteGroupBuilder` will use the prefix in their route templates.
- You can also call `AddEndpointFilter()` on route groups. Any endpoints defined on the group will also have the filter, as though you defined them on the endpoint directly, removing the need to duplicate the call on each endpoint.
