30.4 Creating a custom IHostBuilder

30.5 Understanding the complexity of the generic host

30.6 Choosing between the generic host and minimal hosting

31 Advanced configuration of ASP.NET Core

31.1 Customizing your middleware pipeline

Creating simple apps with the Run extension

Branching middleware pipelines with the Map extension

Adding to the pipeline with the Use extension

Building a custom middleware component

Converting middleware into endpoint routing endpoints

31.2 Using DI with OptionsBuilder and IConfigureOptions

31.3 Using a third-party dependency injection container

32 Building custom MVC and Razor Pages components

32.1 Creating a custom Razor Tag Helper

Printing environment information with a custom Tag Helper

Creating a custom Tag Helper to conditionally hide elements

Creating a Tag Helper to convert Markdown to HTML

32.2 View components: Adding logic to partial views

32.3 Building a custom validation attribute

32.4 Replacing the validation framework with FluentValidation

Comparing FluentValidation with DataAnnotations attributes

Adding FluentValidation to your application

33 Calling remote APIs with IHttpClientFactory

33.1 Calling HTTP APIs: The problem with HttpClient

33.2 Creating HttpClients with IHttpClientFactory

Using IHttpClientFactory to manage HttpClientHandler lifetime

Configuring named clients at registration time

Using typed clients to encapsulate HTTP calls
