33.3 Handling transient HTTP errors with Polly

33.4 Creating a custom HttpMessageHandler

34 Building background tasks and ser vices

34.1 Running background tasks with IHostedService

Running background tasks on a timer

Using scoped services in background tasks

34.2 Creating headless worker services using IHost

Creating a worker service from a template

Running worker services in production

34.3 Coordinating background tasks using Quartz.NET

Installing Quartz.NET in an ASP.NET Core application

Configuring a job to run on a schedule with Quartz.NET

Using clustering to add redundancy to your background tasks

35 Testing applications with xUnit

35.1 An introduction to testing in ASP.NET Core

35.2 Creating your first test project with xUnit

35.3 Running tests with dotnet test

35.4 Referencing your app from your test project

35.5 Adding Fact and Theory unit tests

35.6 Testing failure conditions

36 Testing ASP.NET Core applications

36.1 Unit testing custom middleware

36.2 Unit testing API controllers and minimal API endpoints

36.3 Integration testing: Testing your whole app in-memory

Creating a TestServer using the Test Host package

Testing your application with WebApplicationFactory

Replacing dependencies in WebApplicationFactory

Reducing duplication by creating a custom WebApplicationFactory
