To avoid this problem, it's possible to add more *constraints* to a route template that must be satisfied for a URL to be considered a match. You can define constraints in a route template for a given route parameter by using : (colon). `{id:int}`, for example, would add the `IntRouteConstraint` to the `id` parameter. For a given URL to be considered a match, the value assigned to the `id` route value must be convertible to an integer.

You can apply a large number of route constraints to route templates to ensure that route values are convertible to appropriate types. You can also check more advanced constraints, such as that an integer value has a particular minimum value, that a string value has a maximum length, or that a value matches a given regular expression. Table 6.2 describes some of the available constraints. You can find a more complete list online in Microsoft's documentation at http://mng.bz/BmRJ.

Table 6.2 A few route constraints and their behavior when applied
