parameter.

6.3.4 Matching arbitrary URLs with the catch-all parameter

You've seen how route templates take URL segments and attempt to match them to parameters or literal strings. These segments normally split around the slash character, `/`, so the route parameters themselves won't contain a slash. What do you do if you need them to contain a slash or don't know how many segments you're going to have?

Imagine that you're building a currency-converter application that shows the exchange rate from one currency to one or more other currencies. You're told that the URLs for this page should contain all the currencies as separate segments. Here are some examples:

- `/USD/convert/GBP`—Show USD with exchange rate to GBP.
- `/USD/convert/GBP/EUR`—Show USD with exchange rates to GBP and EUR.
- `/USD/convert/GBP/EUR/CAD`—Show USD with exchange rates for GBP, EUR, and CAD.

If you want to support showing any number of currencies, as these URLs do, you need a way to capture everything after the `convert` segment. You could achieve this goal by using a catch-all parameter in the route template, as shown in figure 6.7.
