- `permanent=true`, `preserveMethod=false`—`301 Moved Permanently`
- `permanent=false`, `preserveMethod=true`—`307 Temporary Redirect`
- `permanent=true`, `preserveMethod=true`—`308 Permanent Redirect`

**NOTE** Each of the redirect status codes has a slightly different semantic meaning, though in practice, many sites simply use `302`. Be careful with the permanent move status codes; they'll cause browsers to never call the original URL, always favoring the redirect location. For a good explanation of these codes (and the useful `303 See Other` status code), see the Mozilla documentation at http://mng.bz/x4GB.

As well as redirecting to a specific endpoint, you can redirect to an arbitrary URL by using the `Results.Redirect()` method. This method works in the same way as `RedirectToRoute()` but takes a URL instead of a route name and can be useful for redirecting to external URLs.

Whether you're generating URLs by using `LinkGenerator` or `RedirectToRoute()`, you need to be careful in these route generation methods. Make sure to provide the correct endpoint name and any necessary route parameters. If you get something wrong—if you have a typo in your endpoint name or forget to include a required route parameter, for example—the URL generated will be `null`. Sometimes it's worth checking the generated URL for `null` explicitly to make sure that there are no problems.
