6.4.3 Controlling your generated URLs with RouteOptions

Your endpoint routes are the public surface of your APIs, so you may well have opinions on how they should look. By default, `LinkGenerator` does its best to generate routes the same way you define them; if you define an endpoint with the route template `/MyRoute`, `LinkGenerator` generates the path `/MyRoute`. But what if that path isn't what you want? What if you'd rather have `LinkGenerator` produce prettier paths, such as `/myroute` or `/myroute/`? In this section you'll learn how to configure URL generation both globally and on a case-by-case basis.

NOTE Whether to add a trailing slash to your URLs is largely a question of taste, but the choice has some implications in terms of both usability and search results. I typically choose to add trailing slashes for Razor Pages applications but not for APIs. For details, see http://mng.bz/Ao1W.

When ASP.NET Core matches an incoming URL against your route templates by using routing, it uses a case-insensitive comparison, as you saw in chapter 5. So if you have a route template `/MyRoute`, requests to `/myroute`, `/MYROUTE`, and even `/myROUTE` match. But when generating URLs, `LinkGenerator` needs to choose a single version to use. By default, it uses the same casing that you defined in your route templates. So if you write

```
app.MapGet("/MyRoute", () => "Hello world!").WithName("route1");
```

`LinkGenerator.GetPathByName("route1")` returns `/MyRoute`.
