Although that's a good default, you'd probably prefer that all the links generated by your app be consistent. I like all my links to be lowercase, regardless of whether I accidentally failed to make my route template lowercase.

You can control the route generation rules by using `RouteOptions`. You configure the `RouteOptions` for your app using the `Configure<T>` extension method on `WebApplicationBuilder.Services`, which updates the `RouteOptions` instance for the app using the configuration system.

NOTE You'll learn all about the configuration system and the `Configure<T>` method in chapter 10.

`RouteOptions` contains several configuration options, as shown in listing 6.4. These settings control whether the URLs your app generates are forced to be lowercase, whether the query string should also be lowercase, and whether a trailing slash (`/`) should be appended to the final URLs. In the listing, I set the URL to be lowercased, for the trailing slash to be added, and for the query string to remain unchanged.

NOTE In listing 6.4 the whole path is lowercased, including any route parameter segments such as `{name}`. Only the query string retains its original casing.

Listing 6.4 Configuring link generation using `RouteOptions`

```
WebApplicationBuilder builder = WebApplication.CreateBuilder(args);
builder.Services.Configure<RouteOptions>(o =>      ❶
{                                                  ❶
    o.LowercaseUrls = true;                        ❶
    o.AppendTrailingSlash = true;                  ❶
    o.LowercaseQueryStrings = false;               ❷
```
