ASP.NET Core binds simple types such as `int` and `double`.

7.2 Binding simple types to a request

When you're building minimal API handlers, you'll often want to extract a simple value from the request. If you're loading a list of products in a category, for example, you'll likely need the category's ID, and in the calculator example at the start of section 7.1, you'll need the number to square.

When you create an endpoint handler that contains simple types such as `int`, `string`, and `double`, ASP.NET Core automatically tries to bind the value to a route parameter, or a query string value:

- If the name of the handler parameter matches the name of a route parameter in the route template, ASP.NET Core binds to the associated route value.
- If the name of the handler parameter doesn't match any parameters in the route template, ASP.NET Core tries to bind to a query string value.

If you make a request to `/products/123,` for example, this will match the following endpoint:

```
app.MapGet("/products/{id}", (int id) => $"Received {id}");
```

ASP.NET Core binds the `id` handler argument to the `{id}` route parameter, so the handler function is called with `id=123`. Conversely, if you make a request to `/products?id=456`, this will match the following endpoint instead:
