```
app.MapGet("/products", (int id) => $"Received {id}");
```

In this case, there's no `id` parameter in the route template, so ASP.NET Core binds to the query string instead, and the handler function is called with `id=456`.

In addition to this "automatic" inference, you can force ASP.NET Core to bind from a specific source by adding attributes to the parameters. `[FromRoute]` explicitly binds to route parameters, `[FromQuery]` to the query string, and `[FromHeader]` to header values, as shown in figure 7.2.
