Figure 7.3 shows an example of implementing a simple strongly-typed ID[1] that's treated as a simple type thanks to the `TryParse` method it exposes. When you send a request to `/product/p123`, ASP.NET Core sees that the `ProductId` type used in the endpoint handler contains a `TryParse` method and that the name of the `id` parameter has a matching route parameter name. It creates the `id` argument by calling `ProductId.TryParse()` and passes in the route value, `p123`.
