Razor Pages, you can't replace the JSON serialization library used by minimal APIs, so there's no way to use Newtonsoft.Json instead. But you can customize some of the library's serialization behavior for your minimal APIs.

You can set System.Text.Json, for example, to relax some of its strictness to allow trailing commas in the JSON and control how property names are serialized with code like the following example:

```
WebApplicationBuilder builder = WebApplication.CreateBuilder(args);
builder.Services.ConfigureRouteHandlerJsonOptions(o => {
    o.SerializerOptions.AllowTrailingCommas = true;
    o.SerializerOptions.PropertyNamingPolicy = JsonNamingPolicy.CamelCase;
    o.SerializerOptions.PropertyNameCaseInsensitive = true;
});
```

Typically, the automatic binding for JSON requests is convenient, as most APIs these days are built around JSON requests and responses. The built-in binding uses the most performant approach and eliminates a lot of boilerplate that you'd otherwise need to write yourself. Nevertheless, bear several things in mind when you're binding to the request body:

- You can bind only a single handler parameter to the JSON body. If more than one complex parameter is eligible to bind to the body, you'll get an exception at runtime when the app receives its first request.
- If the request body isn't JSON, the endpoint handler won't run, and the `EndpointMiddleware` will return a `415 Unsupported Media Type` response.
