So how do you access these query string values with minimal APIs? If you create an endpoint like

```
app.MapGet("/products", (int id) => $"Received {id}");
```

a request to `/products?id=123` would bind the `id` parameter to the query string, as you'd expect. But a request that includes two `id` values in the query string, such as `/products?id=123&id=456`, will cause a runtime error, as shown in figure 7.5. ASP.NET Core returns a `400 Bad Request response` without the handler or filter pipeline running at all.
