value you expect isn't there? In section 7.5 we look at how you can choose what happens.

7.5 Making parameters optional with nullables

We've described lots of ways to bind parameters to minimal API endpoints. If you've been experimenting with the code samples and sending requests, you may have noticed that if the endpoint *can't* bind a parameter at runtime, you get an error and a `400 Bad Request` response. If you have an endpoint that binds a parameter to the query string, such as

```
app.MapGet("/products", (int id) => $"Received {id}");
```

but you send a request without a query string or with the wrong name in the query string, such as a request to `/products?p=3`, the `EndpointMiddleware` throws an exception, as shown in figure 7.6. The `id` parameter is required, so if it can't bind, you'll get an error message and a `400 Bad Request` response, and the endpoint handler won't run.

All parameters are required regardless of which binding source they use, whether that's from a route value, a query string value, a header, or the request body. But what if you want a handler parameter to be optional? If you have an endpoint like this one,

```
app.MapGet("/stock/{id?}", (int id) => $"Received {id}");
```
