`[FromServices]` may be necessary in some rare cases if you're using a custom DI container that doesn't support the APIs used by minimal APIs. But generally, I find that I can keep endpoints readable by avoiding the `[From*]` attributes wherever possible and relying on minimal APIs to do the right thing automatically.

7.6.3 Binding file uploads with IFormFile and IFormFileCollection

A common feature of many websites is the ability to upload files. This activity could be relatively infrequent, such as a user's uploading a profile picture to their Stack Overflow profile, or it may be integral to the application, such as uploading photos to Facebook.

Letting users upload files to your application

Uploading files to websites is a common activity, but you should consider carefully whether your application *needs* that ability. Whenever users can upload files, the situation is fraught with danger.

You should be careful to treat the incoming files as potentially malicious. Don't trust the filename provided, take care of large files being uploaded, and don't allow the files to be executed on your server.

Files also raise questions about where the data should be stored: in a database, in the filesystem, or in some other storage? None of these questions has a straightforward answer, and you should think hard about the implications of choosing one over the other. Better, don't let users upload files if you don't have to!

ASP.NET Core supports uploading files by exposing the `IFormFile` interface. You can use this interface in your endpoint handlers, and it will be
