I also wish to thank Tanya Wilke, who served as technical proofreader. Tanya verified that the code I wrote actually ran and made sense, working through the chapters with formidable efficiency.

To everyone at Manning who helped get this book published and marketed, a heartfelt thanks. I'd also like to thank all the MEAP readers for their comments, which helped improve the book in numerous ways.

I would have never been in a position to write this book if not for the excellent content produced by members of the .NET community and those I follow on social media.

Finally, thanks to all those friends who encouraged and supported me, and showed interest generally. We may not have been able to meet up as much as we'd like, but I look forward to getting together for a drink as soon as it's possible.

about this book

This book is about the ASP.NET Core framework, what it is, and how you can use it to build web applications. Although some of this content is already available online, it's scattered around the internet in disparate documents and blog posts. This book guides you through building your first applications, introducing additional complexity as you cement previous concepts.

I present each topic using relatively small examples rather than building on a single example application through the book. There are merits to both approaches, but I wanted to ensure that the focus remained on the specific topics being taught, without the mental overhead of navigating an increasingly large project.
