client, dealing with the complex networking code. Then the framework calls in to handlers (Razor Pages and Web API controllers, for example) that you write using primitives provided by the framework. Finally, these handlers call in to your application's domain logic—typically, C# classes and objects without any dependencies that are specific to ASP.NET Core.

1.2 What types of applications can you build?

ASP.NET Core provides a generalized web framework that you can use to build a wide variety of applications. ASP.NET Core includes APIs that support many paradigms:

- *Minimal APIs*—Simple HTTP APIs that can be consumed by mobile applications or browser-based single-page applications.
- *Web APIs*—An alternative approach to building HTTP APIs that adds more structure and features than minimal APIs.
- *gRPC APIs*—Used to build efficient binary APIs for server-to-server communication using the gRPC protocol.
- *Razor Pages*—Used to build page-based server-rendered applications.
- *MVC controllers*—Similar to Razor Pages. Model-View-Controller (MVC) controller applications are for server-based applications but without the page-based paradigm.
- *Blazor WebAssembly*—A browser-based single-page application framework that uses the WebAssembly standard, similar to JavaScript frameworks such as Angular, React, and Vue.
