- It uses familiar design patterns and paradigms.
- C# is a great language (but you can use VB.NET or F# if you prefer).
- You can build and run on any platform.

ASP.NET Core is a reimagining of the ASP.NET framework, built with modern software design principles on top of the new .NET platform. Although it's new in one sense, .NET (previously called *.NET Core*) has had widespread production use since 2016 and has drawn significantly from the mature, stable, and reliable .NET Framework, which has been used for more than two decades. You can rest easy knowing that by choosing ASP.NET Core and .NET 7, you're getting a dependable platform as well as a full-featured web framework.

One major selling point of ASP.NET Core and .NET 7 is the ability to develop and run on any platform. Whether you're using a Mac, Windows, or Linux computer, you can run the same ASP.NET Core apps and develop across multiple environments. A wide range of distributions are supported for Linux users: RHEL, Ubuntu, Debian, CentOS, Fedora, and openSUSE, to name a few. ASP.NET Core even runs on the tiny Alpine distribution, for truly compact deployments to containers, so you can be confident that your operating system of choice will be a viable option.

If you're already a .NET developer, the choice of whether to invest in ASP.NET Core for new applications was largely a question of timing. Early versions of .NET Core lacked some features that made it hard to adopt, but that problem no longer exists in the latest versions of .NET. Now Microsoft explicitly advises that all new .NET applications should use .NET 7 (or newer).
