

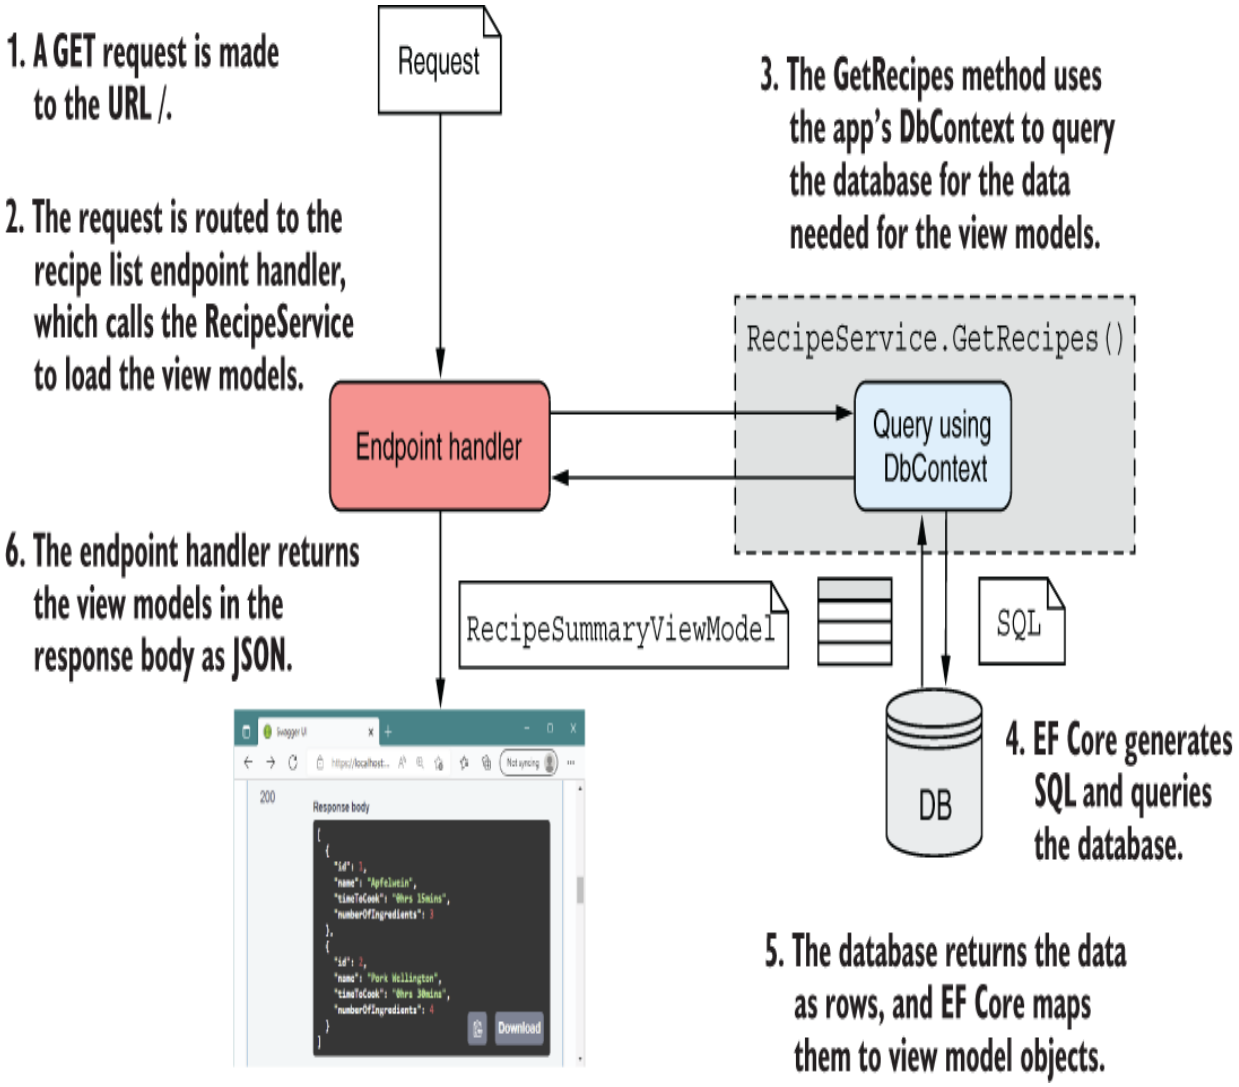

Figure 12.12 Calling the `GET` list endpoint and querying the database to retrieve a list of `RecipeSummaryViewModels`. EF Core generates the SQL to retrieve the necessary fields from the database and maps them to view model objects.

NOTE Creating a view model is technically a UI concern rather than a business-logic concern. I'm returning a view model directly from `RecipeService` here mostly to hammer home the fact that you shouldn't be using EF Core entities directly in your endpoint's public API. Alternatively, you might return the `Recipe` entity directly from the
