❺ Standalone, static HTML

Razor Pages use a templating syntax called *Razor* that combines static HTML with dynamic C# code and HTML generation. The `@page` directive on the first line of the Razor Page is the most important. This directive must always be placed on the first line of the file, as it tells ASP.NET Core that the .cshtml file is a Razor Page. Without it, you won't be able to view your page correctly.

The next line of the Razor Page defines which `PageModel` in your project the Razor Page is associated with:

```
@model PrivacyModel
```

In this case the `PageModel` is called `PrivacyModel`, and it follows the standard convention for naming Razor Page models. You can find this class in the Privacy.cshtml.cs file in the Pages folder of your project, as shown in figure 13.5. Visual Studio nests these files underneath the Razor Page .cshtml files in Solution Explorer. We'll look at the page model in section 13.1.4.
