Just as desktop or mobile development frameworks can help you build native applications, ASP.NET Core makes writing web applications faster, easier, and more secure than trying to build everything from scratch. It contains libraries for common things like

- Creating dynamically changing web pages
- Letting users log in to your web app
- Letting users use their Facebook accounts to log in to your web app
- Providing a common structure for building maintainable applications
- Reading configuration files
- Serving image files
- Logging requests made to your web app

The key to any modern web application is the ability to generate dynamic web pages. A *dynamic web page* may display different data depending on the current logged-in user, or it could display content submitted by users. Without a dynamic framework, it wouldn't be possible to log in to websites or to display any sort of personalized data on a page. In short, websites like Amazon, eBay, and Stack Overflow (shown in figure 2.1) wouldn't be possible. Web frameworks for creating dynamic web pages are almost as old as the web itself, and Microsoft has created several over the years, so why create a new one?
