NOTE I've covered MVC controllers only in passing, as I generally don't recommend them over Razor Pages or minimal APIs, so don't worry too much about them. We'll come back to MVC controllers in chapters 19 and 20; the main reason for mentioning them here is to point out how similar MVC controllers are to Razor Pages.

The following listing shows an MVC controller generating a link from one action method to another, using the `Url` helper from the `Controller` base class.

Listing 14.3 Generating a URL using `IUrlHelper` and the action name

```
public class CurrencyController : Controller      ❶
{
    [HttpGet("currency/index")]                   ❷
    public IActionResult Index()
    {
        var url = Url.Action("View", "Currency",  ❸
            new { code = "USD" });                ❸
        return Content($"The URL is {url}");      ❹
    }

    [HttpGet("currency/view/{code}")]
    public IActionResult View(string code)        ❺
    {
         /* method implementation*/
    }
}
```

❶ Deriving from Controller gives access to the Url property.

❷ Explicit route templates using attributes

❸ You provide the action and controller name to generate, along with any additional route values.

❹ Returns "The URL is /Currency/View/USD"

❺ The URL generated a route to this action method.

You can call the `Action` and `Page` methods on `IUrlHelper` from both Razor Pages and MVC controllers, so you can generate links back and forth between them if you need to. The important question is, what is the
