```
WebApplication app = builder.Build();

app.MapRazorPages();

app.Run();
```

❶ Changes the conventions used to generate URLs. By default, these properties are false.

To use kebab-case for your application, annoyingly you must create a custom parameter transformer. This is a somewhat advanced topic, but it's relatively simple to implement in this case. The following listing shows how you can create a parameter transformer that uses a regular expression to replace PascalCase values in a generated URL with kebab-case.

Listing 14.6 Creating a kebab-case parameter transformer

```
public class KebabCaseParameterTransformer            ❶
    : IOutboundParameterTransformer                   ❶
{
    public string TransformOutbound(object? value)
    {
        if (value is null) return null;               ❷

        return Regex.Replace(value.ToString(),        ❸
            "([a-z])([A-Z])", "$1-$2").ToLower();     ❸
    }
}
```

❶ Creates a class that implements the parameter transformer interface

❷ Guards against null values to prevent runtime exceptions

❸ The regular expression replaces PascalCase patterns with kebab-case.

Source generators in .NET 7

One of the exciting features introduced in C# 9 was source generators. Source generators are a compiler feature that let you inspect code as it's compiled and generate new C# files on the fly, which are included in the compilation. Source generators have the potential to dramatically
