Conventions are a key feature of Razor Pages, and you should lean on them whenever you can. Although you can override the route templates for individual Razor Pages manually, as you've seen in previous sections, I advise against it where possible. In particular,

- *Avoid* replacing the route template with an absolute path in a page's `@page` directive.
- *Avoid* adding literal segments to the `@page` directive. Rely on the file hierarchy instead.
- *Avoid* adding additional route templates to a Razor Page with the `AddPageRoute()` convention. Having multiple URLs to access a page can often be confusing.
- *Do* add route parameters to the `@page` directive to make your routes dynamic, as in `@page "{name}".`
- *Do* consider using global conventions when you want to change the route templates for all your Razor Pages, such as using kebab-case, as you saw earlier.

In a nutshell, these rules say "Stick to the conventions." The danger, if you don't, is that you may accidentally create two Razor Pages that have overlapping route templates. Unfortunately, if you end up in that situation, you *won't* get an error at compile time. Instead, you'll get an exception at runtime when your application receives a request that matches multiple route templates, as shown in figure 14.4.
